

Setting Up a Server Using iMacros

Download iMacro

If you're using Firefox and testing LAMS, you should consider installing the iMacro plugin for initial setup and configuration tasks.

[Get the iMacros plugin here..](#)

Custom Download Script

You can download [this script](#) and save it to your macros folder (usually *C:\Documents\iMacros\Macros*).

It will create a course called **Demonstration**, and four accounts:

Author/Monitor	Learner
teacher	learner1
	learner2
	learner3

All user passwords are the same as the user name.

You will need to change one line of code - open the .iim file in a text editor, and change the URL on the third line to the server which you want to customise:

```
URL GOTO=http://CHANGE_THIS_URL/lams/
```

You can also change the sysadmin login name and password by editing the **CONTENT=** tag in lines **4** and **7** of the .iim file.

Enjoy!
