

Creating Wink Pages

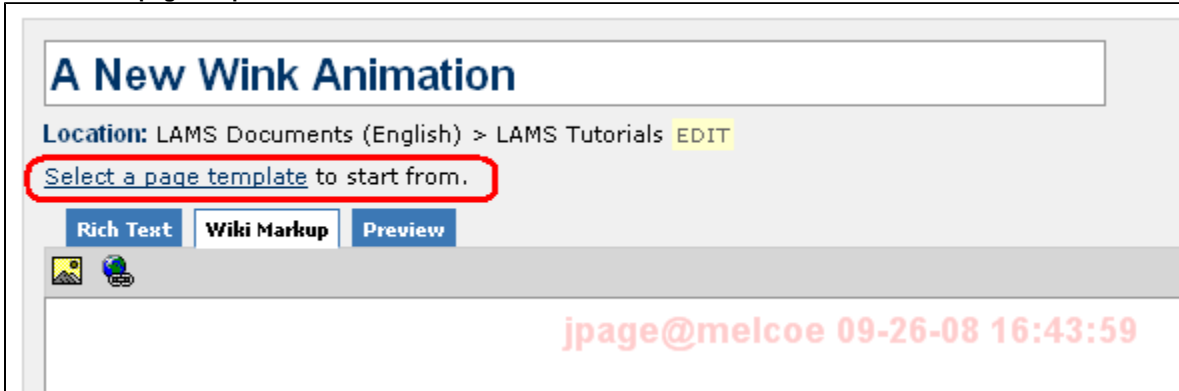

Here are the steps for creating wink pages in translation sites.

Make sure you are editing the page using **Wiki Markup** notation.
The !! embedding macro will not work properly using **Rich Text** view.

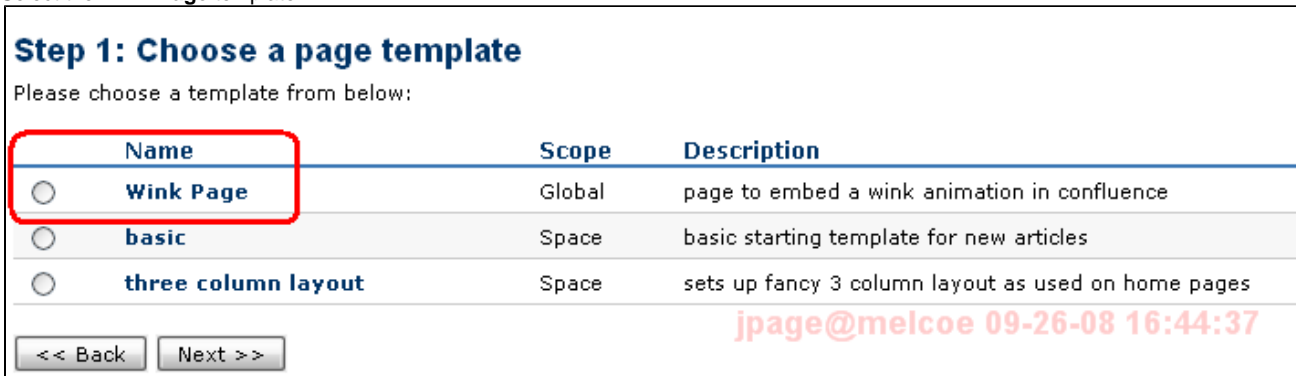

1. Compile the animation in the Wink program - you will need the **.swf** file that the wink program creates.
2. Create a page in Confluence with an appropriate title, eg: **A New Wink Animation**

3. Click **Select a page template**

4. Select the **Wink Page** template

5. **Save the page.**

You must save the page before you upload attachments, as new pages cannot have attachments until they are created and saved.

6. Click **Attachments**
7. Upload the **.swf** file.

8. Remember the file name of the .swf that was just uploaded.

Make sure to only use the **filename** not the **URL** of the attachment.

9. Go back to the created page and click edit.

10. Make several changes in Wiki markup mode:

- Replace **wink_filename.swf** with the filename of the .swf you copied; eg. WhatsLams.swf
- Change the **WIDTH** and **HEIGHT** numbers to the width and height of the animation. (You can find these from the wink program itself, displayed in the bottom right corner; alternatively, they are in the html file that Wink creates alongside the .swf)
- Make any other changes to the page, such as headings, excerpts or links, etc.
